

# I am still in progress to figuring out how to build a frontend and modify data base.

1. set up a rails server
2. create a model and a controller
3. set up a root route
4. configure a database
5. build an interactive view
6. refine the website

Some basic features of the website:

When user types in a words in the view and press enter, the words will be saved in database with an index (from 1, 2, 3 onwards) and with three tails (due date, due or finished) The user can choose due date, and it will be saved in database in another column. If the user did not choose any due date, the cell will be nil. When the user 'tick' the task, it will be marked as finished. This action can be undone.
